- Core NUGA sample is **boldfaced**.
- Positions, host types, velocities, and inclinations are from NED. Distances are from Tully's *Nearby Galaxies Catalog*, when available.
- Nuclear types are from Ho, Filippenko, & Sargent (1997), except for NGC 5953, NGC 6574, NGC 6764, and NGC 7469. H = HII region, S = Seyfert, L = LINER, T = transition object.

1. Core NUGA sample is **boldfaced**.
2. 30 m CO observations are from unpublished work (AJB) or the survey of Braine et al. (1993: B93). All sources have 23'' resolution data in both CO(1-0) and CO(2-1), except for NGC 3359 which has 12'' resolution CO(2-1) data, and NGC 4579 which has only CO(1-0) data.
3. CAM, PHT, SWS, and LWS columns indicate existence of ISO data; WFPC, STIS, and NICMOS columns indicate existence of HST data; VLA column indicates configurations for which HI data have been taken (if any). SIRTF column indicates whether a source has been reserved for a GTO program (Rieke for NGC 2782 and NGC 5953) or for a legacy program (SINGS for NGC 3627, NGC 4569, NGC 4579, and NGC 4826).
